CYBERSECURITY ADVISORY

Chinese State-Sponsored Cyber Operations: Observed TTPs

Last Revised: August 20, 2021

Alert Code: AA21-200B

Summary

This advisory uses the MITRE Adversarial Tactics, Techniques, and Common Knowledge (ATT&CK®) framework, Version 9, and MITRE D3FEND™ framework, version 0.9.2-BETA-3. See the [ATT&CK for Enterprise](https://attack.mitre.org/versions/v8/techniques/enterprise/) <<https://attack.mitre.org/versions/v8/techniques/enterprise/>> for all referenced threat actor tactics and techniques and the [D3FEND framework](https://d3fend.mitre.org/) <<https://d3fend.mitre.org/>> for referenced defensive tactics and techniques.

[Give Feedback](#)

The National Security Agency, Cybersecurity and Infrastructure Security Agency (CISA), and Federal Bureau of Investigation (FBI) assess that People's Republic of China state-sponsored malicious cyber activity is a major threat to U.S. and Allied cyberspace assets. Chinese state-sponsored cyber actors aggressively target U.S. and allied political, economic, military, educational, and critical infrastructure (CI) personnel and organizations to steal sensitive data, critical and emerging key technologies, intellectual property, and personally identifiable information (PII). Some target sectors include managed service providers, semiconductor companies, the Defense Industrial Base (DIB), universities, and medical institutions. These cyber operations support China's long-term economic and military development objectives.

This Joint Cybersecurity Advisory (CSA) provides information on tactics, techniques, and procedures (TTPs) used by Chinese state-sponsored cyber actors. This advisory builds on previous NSA, CISA, and FBI reporting to inform federal, state, local, tribal, and territorial (SLTT) government, CI, DIB, and private industry organizations about notable trends and persistent TTPs through collaborative, proactive, and retrospective analysis.

To increase the defensive posture of their critical networks and reduce the risk of Chinese malicious cyber activity, NSA, CISA, and FBI urge government, CI, DIB, and private industry organizations to apply the recommendations listed in the Mitigations section of this advisory and in Appendix A: Chinese State-sponsored Cyber Actors' Observed Procedures

Note: NSA, CISA, and FBI encourage organization leaders to review CISA Joint Insights: Chinese Malicious Cyber Activity: Threat Overview for Leaders for information on this threat to their organization.

Technical Details

Trends in Chinese State-Sponsored Cyber Operations

NSA, CISA, and FBI have observed increasingly sophisticated Chinese state-sponsored cyber activity targeting U.S. political, economic, military, educational, and CI personnel and organizations. NSA, CISA, and FBI have identified the following trends in Chinese state-sponsored malicious cyber operations through proactive and retrospective analysis:

- **Acquisition of Infrastructure and Capabilities.** Chinese state-sponsored cyber actors remain agile and cognizant of the information security community's practices. These actors take effort to mask their activities by using a revolving series of virtual private servers (VPSs) and common open-source or commercial penetration tools.
- **Exploitation of Public Vulnerabilities.** Chinese state-sponsored cyber actors consistently scan target networks for critical and high vulnerabilities within days of the vulnerability's public disclosure. In many cases, these cyber actors seek to exploit vulnerabilities in major applications, such as Pulse Secure, Apache, F5 Big-IP, and Microsoft products. For information on Common Vulnerabilities and Exposures (CVE) known to be exploited by malicious Chinese state-sponsored cyber actors, see:
 - CISA-FBI Joint CSA AA20-133A: [Top 10 Routinely Exploited Vulnerabilities](https://us-cert.cisa.gov/ncas/alerts/aa20-133a) <<https://us-cert.cisa.gov/ncas/alerts/aa20-133a>>,
 - CISA Activity Alert: AA20-275A: [Potential for China Cyber Response to Heightened U.S.-China Tensions](https://us-cert.cisa.gov/ncas/alerts/aa20-275a) <<https://us-cert.cisa.gov/ncas/alerts/aa20-275a>>, and
 - NSA CSA U/OO/179811-20: [Chinese State-Sponsored Actors Exploit Publicly Known Vulnerabilities](https://media.defense.gov/2020/oct/20/2002519884/-1/-1/0/csa_chinese_exploit_vulnerabilities_uoo_179811.pdf)
<https://media.defense.gov/2020/oct/20/2002519884/-1/-1/0/csa_chinese_exploit_vulnerabilities_uoo_179811.pdf>.
- **Encrypted Multi-Hop Proxies.** Chinese state-sponsored cyber actors have been routinely observed using a VPS as an encrypted proxy. The cyber actors use the VPS as well as small office and home office (SOHO) devices as operational nodes to evade detection.

Give Feedback

Observed Tactics and Techniques

Chinese state-sponsored cyber actors use a full array of tactics and techniques to exploit computer networks of interest worldwide and to acquire sensitive intellectual property, economic, political, and military information. Appendix B: MITRE ATT&CK Framework lists the tactics and techniques used by Chinese state-sponsored cyber actors. A downloadable JSON file <<https://github.com/nsacyber/chinese-state-sponsored-cyber-operations-observed-ttps>> is also available on the NSA Cybersecurity GitHub page <<https://github.com/nsacyber>>.

Refer to Appendix A: Chinese State-Sponsored Cyber Actors' Observed Procedures for information on procedures affiliated with these tactics and techniques as well as applicable mitigations.

Figure 1: Example of tactics and techniques used in various cyber operations.

Mitigations

NSA, CISA, and FBI urge federal and SLTT government, CI, DIB, and private industry organizations to apply the following recommendations as well as the detection and mitigation recommendations in Appendix A, which are tailored to observed tactics and techniques:

Give Feedback

- **Patch systems and equipment promptly and diligently.** Focus on patching critical and high vulnerabilities that allow for remote code execution or denial-of-service on externally facing equipment and CVEs known to be exploited by Chinese state-sponsored cyber actors. Consider implementing a patch management program that enables a timely and thorough patching cycle.

Note: for more information on CVEs routinely exploited by Chinese state-sponsored cyber actors refer to the resources listed in the Trends in Chinese State-Sponsored Cyber Operations section.

- **Enhance monitoring of network traffic, email, and endpoint systems.** Review network signatures and indicators for focused activities, monitor for new phishing themes, and adjust email rules accordingly. Follow the best practices of restricting attachments via email and blocking URLs and domains based upon reputation. Ensure that log information is aggregated and correlated to enable maximum detection capabilities, with a focus on monitoring for account misuse. Monitor common ports and protocols for command and control (C2) activity. SSL/TLS inspection can be used to see the contents of encrypted sessions to look for network-based indicators of malware communication protocols. Implement and enhance network and endpoint event analysis and detection capabilities to identify initial infections, compromised credentials, and the manipulation of endpoint processes and files.
- **Use protection capabilities to stop malicious activity.** Implement anti-virus software and other endpoint protection capabilities to automatically detect and prevent malicious files from executing. Use a network intrusion detection and prevention system to identify and prevent commonly employed adversarial malware and limit nefarious data transfers. Use a domain reputation service to detect suspicious or malicious domains. Use strong credentials for service accounts and multi-factor authentication (MFA) for remote access to mitigate an adversary's ability to leverage stolen credentials, but be aware of MFA interception techniques for some MFA implementations.

Application Layer Protocol [T1071] <<https://attack.mitre.org/version/s/v9/techniques/t1071>>]

Chinese state-sponsored cyber actors have been observed:

- Using commercial cloud storage services for command and control.

Use network intrusion detection and prevention systems with network signatures to identify traffic for specific adversary malware.

Detect:

Non-Standard Port [T1571
<https://attack.mitre.org/version/s/v9/techniques/t1571>]

Chinese state-sponsored cyber actors have been observed using a non-standard SSH port to establish covert communication channels with VPS infrastructure.

- Use signature-based network intrusion detection and prevention systems to identify adversary malware calling back to C2.
- Configure firewalls to limit outgoing traffic to only required ports based on the functions of that network segment.

Contact Information

To report suspicious or criminal activity related to information found in this Joint Cybersecurity Advisory, contact your local FBI field office at www.fbi.gov/contact-us/field or by e-mail at CyWatch@fbi.gov. When available, please include the following information regarding the incident: date, time, and location of the incident; type of activity; number of people affected; type of equipment used for the activity; the name of the submitting company or organization; and a designated point of contact.

To request incident response resources or technical assistance related to these threats, contact CISA at Central@cisa.dhs.gov.

For NSA client requirements or general cybersecurity inquiries, contact the NSA Cybersecurity Requirements Center at 410-854-4200 or Cybersecurity_Requests@nsa.gov.

Media Inquiries / Press Desk:

- NSA Media Relations, 443-634-0721, MediaRelations@nsa.gov
- CISA Media Relations, 703-235-2010, CISAMedia@cisa.dhs.gov
- FBI National Press Office, 202-324-3691, npo@fbi.gov
